

FRAUD INVESTIGATION AUDIT REPORT

Generated: 2026-06-14 13:06:31 UTC
Analysis ID: N/A

SYSTEM DECISION: ALLOW_TRANSACTION — STATUS: AUTHORIZED

1. TRANSACTION TELEMETRY PROFILE

Transaction ID	TX_518A65D9FC1344D6A92441E6E537429B	Timestamp	2026-06-14T13:03:29Z
Customer ID	CUST_00792	Payment Method	UPI
Device Fingerprint	DEV_00098	IP Address	122.161.54.242
Amount / Currency	247.69 GBP	International	False
Origin Country	IN	Destination Country	IN

2. SPECIALIZED FRAUD AGENTS INDEPENDENT VERDICTS

BEHAVIORAL ENGINE FINDINGS

- score: 0.08

- reasoning: The current transaction profile exhibits minimal fraud indicators across all analyzed telemetry vectors. Session duration (2.0 minutes) and typing speed flags align with standard human interaction patterns, directly contrasting the high-risk RAG baseline which correlates account takeover attempts with sub-one-minute sessions, typing anomalies, and elevated 24-hour failure counts (9-14). Velocity metrics show zero failed transactions in the last 24 hours, and the transaction amount (£247.69) remains within expected variance against the 7-day average (£170.81), with no unusual amount or location flags triggered. Biometric telemetry, automation detection, and device risk scoring (5.08) further confirm a clean behavioral profile. Cross-referencing with the RAG context reveals no alignment with known fraud ring edges, shared mule devices, or sanction/PEP risks, and the orchestrator's initial low-probability assessment (0.03) is fully substantiated by the absence of velocity spikes, biometric anomalies, or script-based attack vectors.

- confidence: 0.92

NETWORK GRAPH LINKAGE ANALYSIS

No analysis data recorded.

LEGAL & SANCTIONS COMPLIANCE AUDIT

- risk_score: 0.12
- violations: None
- reasoning: Forensic audit confirms zero exposure to sanctioned jurisdictions; origin/destination routing (IN to IN) does not intersect with high-risk or critical sanction lists provided in regulatory context. PEP screening returned negative status, and beneficiary risk is rated LOW. Structuring/smurfing detection thresholds are untriggered: the £247.69 principal amount and 4-transaction daily frequency remain substantially below regulatory reporting limits for sequential value splitting or threshold evasion. A technical metadata discrepancy exists between GBP currency and UPI payment rails within a domestic Indian route, but it does not indicate cross-border routing evasion, trade-based laundering, or illicit currency standard violation per current telemetry and orchestrator decision logs. All behavioral flags, account maturity (1289 days), device risk metrics, and session analytics align with baseline low-risk parameters.
- confidence: 0.96

3. CENTRAL ORCHESTRATOR SUMMARY SYNTHESIS

Assessed Risk Level: LOW | **Consensus Confidence:** 0.95

All available telemetry modules demonstrate strong consensus indicating a low-risk transaction. The Anomaly Model Matrix permits the transaction with a low realtime risk score (20.83) and zero fraud prediction. Behavioral analysis confirms a clean profile with minimal fraud indicators, normal interaction patterns, and no velocity or biometric anomalies, yielding a confidence of 0.92. Compliance screening validates zero regulatory exposure, negative PEP status, and domestic routing integrity, with confidence at 0.96. Despite the absence of Network Graph telemetry, the overlapping low-risk scores and high-confidence validations across behavioral and compliance vectors firmly substantiate a LOW risk classification. The minor currency-rail metadata discrepancy on a domestic route is deemed benign and non-evasive.
