

FRAUD INVESTIGATION AUDIT REPORT

Generated: 2026-06-14 12:43:07 UTC
Analysis ID: N/A

SYSTEM DECISION: ALLOW_TRANSACTION — STATUS: AUTHORIZED

1. TRANSACTION TELEMETRY PROFILE

Transaction ID	TX_57E6765C2E234D4FAC7E0B6FCB74FBF0	Timestamp	2026-06-14T12:38:20Z
Customer ID	CUST_00076	Payment Method	UPI
Device Fingerprint	DEV_00173	IP Address	122.161.48.15
Amount / Currency	290.15 CAD	International	False
Origin Country	IN	Destination Country	IN

2. SPECIALIZED FRAUD AGENTS INDEPENDENT VERDICTS

BEHAVIORAL ENGINE FINDINGS

- score: 0.12

- reasoning: The transaction profile demonstrates a low-risk behavioral signature that closely aligns with the benign historical baseline documented in Evidence 3 and 4 of the RAG context. Session telemetry reveals a standard interaction duration of 2.0 minutes, normal typing metrics, and zero biometric anomalies, directly contradicting the rapid-input, high-failure patterns characteristic of account takeover attempts observed in Evidence 1, 2, and 5. Velocity analysis confirms operational stability with zero failed transactions over the past 24 hours and a low transaction frequency (2/24h). Although the current amount (290.15 CAD) exceeds the 7-day average by approximately 2.7x, the system has explicitly cleared this as an unusual amount flag, indicating it remains within acceptable behavioral variance for an account aged 1541 days. Cross-referencing against graph and risk agent contexts confirms no shared-device mule activity, fraud ring associations, or sanction/PEP matches. The consolidated telemetry strongly supports a legitimate user session with minimal fraud probability.

- confidence: 0.92

NETWORK GRAPH LINKAGE ANALYSIS

Agent stopped due to max iterations.

LEGAL & SANCTIONS COMPLIANCE AUDIT

- risk_score: 0.06
- violations: None
- reasoning: Forensic audit confirms zero regulatory exposure across all mandated AML/KYC parameters. The transaction is strictly domestic (origin and destination both mapped to India, `is\_international: False`), which explicitly nullifies cross-border sanction screening against high-risk jurisdictions (e.g., RU, SY) and eliminates cross-border currency standard mismatch liability. Transaction value (\$290.15 CAD) and 24-hour frequency (2) are substantially below statutory reporting thresholds (e.g., \$10,000 USD/CAD), with no sequential or fragmented patterns indicative of structuring/smurfing. System telemetry explicitly confirms `sanction\_list\_match: False`, `pep\_flag: False`, and `beneficiary\_risk\_rating: LOW`. Account maturity (1541 days), normal behavioral telemetry, and absence of fraud/routing anomalies further substantiate a compliant baseline. No explicit or implicit AML provisions are breached.
- confidence: 0.98

3. CENTRAL ORCHESTRATOR SUMMARY SYNTHESIS

Assessed Risk Level: LOW | **Consensus Confidence:** 0.95

All active risk modules demonstrate strong consensus on a LOW risk classification. The Anomaly Model assigns a low real-time risk score (20.79) with a zero fraud prediction. Behavioral telemetry confirms a benign session profile characterized by standard interaction metrics, stable velocity, and explicit system clearance for the transaction amount relative to account history. Compliance analysis verifies strict adherence to AML/KYC standards, citing zero regulatory exposure, domestic routing, absence of sanctions/PEP matches, and values well below statutory reporting thresholds. Although the Network Graph agent yielded no data due to iteration limits, it does not contradict the robust alignment across the Anomaly, Behavioral, and Compliance channels. The consolidated evidence strongly supports a legitimate user session with minimal fraud or compliance risk.
